JEAN LUTZ SA VISION SOFTWARE

To enable long distance communication with real time display of measurements and recording for the DIALOG Jean Lutz SA presents a new software package.

**Vision software provides remote display in real time of data and measurements:**

- Real time display of the DIALOG screen (screen-shot) on your PC/laptop.
- Measurements and machine parameters in real time via widgets (manometer, counters...)
- Historical measurements made by the Dialog, a graphic display against time.
- Alert messages like "start recording", "transfer", etc
- GPS positioning of each machine on a map, similar to "Google Map"
- Access to information for each machine working

The software stores the parameters in configuration even if changes are made at the Dialog ( parameters are kept at JLSA server)

All these functions are only possible if the DIALOG is equipped with a SIM card and the computer where the Vision software is installed has an internet connection.

**This application provides a new level of technical assistance to your operators.**

**In conclusion this software not only allows monitoring of the jobsite in real time but also provides a new level of maintenance to the remote device, reducing the requirement for site visits.**
